For files in nlpProject folder, there are 3 executable python files: naive.py, separate.py, together.py:
naive.py is used to show naive result;
separate.py is used to show 6 features' result separately and compared it to naive result;
together.py is used to show all feathures' results together and compared it to naive result.

For naive.py and together.py you can just execute it. And for separate.py, since there are 6 features, you should switch features by change value of variable "method" in line 17 of separate.py. The method to change are as follows:

method=tok: show token feature
method=part: show POS feature
method=lem: show lemmatize feature
method=l: show lesk feature
method=syn: show synonymy feature
method=dep: show dependency feature
